The authors would like to express their appreciation to J. Zoë Beckerman and Sara Rosenbaum, George Washington University’s Milken Institute School of Public Health; Alice Lind, Washington Health Care Authority; and Ashley Wennerstrom, LSU School of Public Health and Medicine for their insights and feedback in the development of this toolkit. The authors would also like to thank Tricia McGinnis from the Center for Health Care Strategies for lending her subject matter expertise and guidance throughout this process.

About the Center for Health Care Strategies

The Center for Health Care Strategies (CHCS) is a nonprofit policy center dedicated to improving the health of low-income Americans. It works with state and federal agencies, health plans, providers, and community-based organizations to develop innovative programs that better serve beneficiaries of publicly financed care, especially those with complex, high-cost needs. To learn more, visit www.chcs.org.
I. Introduction

Primary care is the backbone of any high-functioning health care system, particularly for low-income populations. Greater use of primary care is associated with lower costs, higher patient satisfaction, fewer hospitalizations and emergency department visits, and lower mortality.¹

Traditionally, state Medicaid agencies have focused on enhancing primary care access — boosting Medicaid enrollment of providers, ensuring rates are sufficient to maintain access, and requiring managed care networks to have a sufficient number of primary care providers (PCPs) accepting patients within a given geography. However, that approach has limitations. Medicaid populations often have a broader range of complex health-related needs, requiring a primary care system that can fully respond to those needs.

In response, recently states have sought more advanced primary care models. These states ask not only if a patient has a relationship with a primary care provider, but also how the primary care team manages and addresses the diverse health-related needs of patients. Using technology and team-based care, these advanced primary care models seek to address not only physical health, but also behavioral health and social needs.

At the same time, states are becoming more sophisticated purchasers through their managed care programs. Yet, defining how managed care organizations (MCOs) can best support primary care innovation (PCI) is a challenge. The state must define goals, roles, and responsibilities for all parties involved — states, plans, providers, and patients — through an agreement between the plan and the state.

This toolkit is designed to help states leverage their managed care contracts and request for proposals (RFPs) to advance PCI. It is a product of Advancing Primary Care Innovation in Medicaid Managed Care, a national learning collaborative made possible by The Commonwealth Fund and led by the Center for Health Care Strategies (CHCS). Under the first phase of the collaborative, CHCS assisted five states — Louisiana, Hawaii, Pennsylvania, Rhode Island, and Washington State — in using their managed care purchasing authority to advance primary care models. The toolkit summarizes strategies used by these five states and others, including contract and procurement language, to inform additional states interested in advancing PCI.
Advancing Primary Care Innovation in Medicaid Managed Care: A Toolkit for States

It details three steps for approaching PCI work:

1. **Identify PCI priorities.** Assess the landscape, articulate a vision, and ask for feedback from patients, plans, providers, and community-based organizations (CBOs).

2. **Design a PCI strategy.** Maximize state procurement and contracting processes, leverage MCO functions, and chart a path to advance PCI.

3. **Advance targeted care delivery goals.** Consider how to use managed care contracts to achieve targeted care delivery goals, such as:
   - Identifying and addressing social needs;
   - Integrating behavioral health into primary care;
   - Enhancing team-based primary care approaches to support the community’s needs; and
   - Using technology to improve access to care.

In addition to outlining design considerations and state approaches relevant to these four care delivery areas, this toolkit summarizes how three states — New York, Ohio, and Oregon — promote enhanced care delivery transformation through their standards for patient-centered medical homes (PCMHs).

Although this toolkit addresses a range of common state activities that can advance PCI, it primarily focuses on activities that relate to procuring and contracting with MCOs (Exhibit 1). It provides states with a range of potential options to advance PCI in Medicaid managed care.

**Exhibit 1. State Activities to Advance Primary Care Innovation**

- **Convening Stakeholders**
  - State workgroups
  - Advisory committees
  - Managed care workgroups

- **Crafting Vision Documents**
  - Roadmaps
  - White papers
  - Managed care quality strategies

- **Defining Preferred PCI Standards and Models**
  - Accountable care organizations
  - Patient-centered medical homes
  - Comprehensive primary care
  - Preferred value-based payment models

- **Negotiating State Plan Amendments and Waivers**
  - Benefit expansion (e.g., community health workers, health homes) & associated payment methodology
  - Pilot programs

- **Procuring and Contracting with MCOs**
  - Requests for information
  - Requests for proposals
  - Managed care contracts

The primary focus of this toolkit
II. Identify PCI Priorities

Advancing PCI can help states improve care and outcomes, control costs, and build on the unique strengths of primary care teams. States can incorporate PCI into a larger transformation strategy relating to, for example: advancing value-based payment (VBP); increasing the effectiveness of care management and coordination; or optimizing the use of scarce behavioral health or other specialty providers. For most states, a first step in designing a PCI strategy involves identifying priorities for primary care specifically, and delivery system and payment reform more generally. Following are three key steps for identifying priorities:

1. Assess the landscape;
2. Articulate a vision; and
3. Ask for feedback and fill in the gaps.

1. Assess the Landscape

Understanding a state’s existing primary care environment is a first step in determining how to best advance PCI in Medicaid managed care. This includes: the size and capacity of the current primary care provider market; penetration of advanced primary care models; prevalence of integrated health care systems and small practices; utilization of primary care and common care gaps among Medicaid members; existing plan activities and quality performance; and population health trends across the state. To focus its PCI efforts, the state Medicaid agency may first identify what data is needed to make key policy decisions and how to obtain such data. Some of this evaluative work may have already been performed through other efforts, including State Innovation Model (SIM) grants or projects driven by state public health departments, state agencies that regulate insurers, or external quality review organizations. For example, Washington State used data collected through SIM, such as expected savings associated with behavioral health integration and the number of advanced practice nurse practitioners providing primary care services, to help guide its PCI efforts. Taking time upfront to analyze existing data and understand the primary care landscape can help facilitate policy and program decisions down the line.

In addition to understanding the state primary care landscape, it is also important to take stock of existing programs related to PCI. This includes understanding other upcoming policy and program changes in the state and the impact they might have on PCI, as well as past efforts to do similar work and what was successful or not successful and why. Agency silos can sometimes create barriers to gathering this internal information. Convening leadership or staff with historical knowledge on this topic can
be useful to help break down these silos and allow the agency to gain a more comprehensive understanding of the environment to support PCI.

2. Articulate a Vision

States often find it useful to create a “roadmap,” vision document, or robust state Medicaid managed care quality strategy as they begin their PCI planning process. For example, Hawaii laid out a vision for investment in primary care within managed care as a part of its renewal application for its 1115 demonstrations. Louisiana developed a whitepaper outlining its vision for the future of its Medicaid managed care program, with investment in PCI as the central focus. Rhode Island created a high-level policy document to explain how its “Next Generation” MCOs would interact with its Medicaid accountable care organizations (ACO). And, Ohio’s quality strategy discussed the role of PCMHs and Comprehensive Primary Care programs in its Medicaid managed care program.

Articulating a clear vision for this work upfront can align all involved parties on goals and key priorities — though changes may still occur along the way. By laying out where the state currently is and where it would like to be, staff can engage with internal and external subject matter experts and stakeholders to identify what steps are needed to achieve goals and identify milestones. The vision document can build support with agency leadership, legislatures, managed care plans, and provider communities, among other important stakeholder communities.

For examples of state vision documents, see Exhibit 2, Examples of Vision Documents: Louisiana and Hawaii, page 6.

3. Ask for Feedback and Fill in the Gaps

Stakeholder engagement helps states assess blind spots in their analysis and better understand the potential impact of these policies on providers, plans, consumers, and communities. This process is beneficial both in the initial stages of PCI strategy development and during the implementation period. It can result in a more informed program or policy change, with broader external buy-in. It can also ensure that the state is apprised of successes and challenges as they arise, and can adjust its strategy accordingly.

In addition to traditional notice and comment processes, states can: (1) leverage existing groups that meet periodically through the agency or through the managed care plans, such as consumer advisory groups or quarterly stakeholder meetings; (2) form new groups dedicated to PCI; (3) participate in cross-state “roadshows”; and (4) design approaches that directly engage consumers and communities. For example, Pennsylvania’s PCMH Advisory Council made recommendations to the state about its PCMH program that helped it take a more strategic approach to PCI. The state’s Secretary of Human Services also embarked on a “Medicaid Innovation Tour” related to social determinants of health (SDOH), learning more about MCO partnerships and projects.
States may engage stakeholders in their PCI work at different times. Ideally, the state will have engaged communities, providers, and plans to inform its landscape analysis and vision development, but some states may prefer to give stakeholders a plan to

**Exhibit 2. Examples of Vision Documents: Louisiana and Hawaii**

**Louisiana’s** Department of Health “will partner with enrollees, providers, and high-performing health plans to build a Medicaid managed care delivery system that improves the health of populations (better health), enhances the experience of care for individuals (better care) and effectively manages Medicaid per capita care costs (lower costs). More specifically, the Department will hold health plans accountable for:

- Advancing evidence-based practices, high-value care, and service excellence;
- Supporting innovation and a culture of continuous quality improvement;
- Ensuring enrollees ready access to care, including through non-traditional means such as medical homes and telehealth;
- Improving enrollee health;
- Decreasing fragmentation and increasing integration across providers and care settings, particularly for enrollees with behavioral health needs;
- Using a population health approach to maximize enrollee health, supported by health information technology, to advance health equity and address social determinants of health;
- Reducing complexity and administrative burden for providers and enrollees;
- Aligning financial incentives for plans and providers and building shared capacity to improve health care quality through data and collaboration; and
- Minimizing wasteful spending, abuse and fraud.”

**Hawaii’s** Department of Human Services, Med-QUEST Division (MQD) “is committed to laying the foundation for innovative programs that support and create healthy families and healthy communities. To accomplish this goal, MQD is building the Hawai’i Ohana Nui Project Expansion (HOPE) program, a five-year initiative to develop and implement a roadmap to achieve this vision of healthy families and healthy communities.

MQD’s vision is that the people of Hawai’i embrace health and wellness. MQD’s mission is to empower Hawaii’s residents to improve and sustain wellbeing by developing, promoting and administering innovative and high-quality healthcare programs with aloha. The vision and mission will serve as the “North Star” and guide the work developed through HOPE.

The following guiding principles describe the overarching framework that will be used to develop a transformative healthcare system that focuses on healthy families and healthy communities:

- Assuring continued access to health insurance and health care;
- Emphasis on whole person and whole family care over their life course. Address the social determinants of health;
- Emphasis on health promotion, prevention, and primary care. Emphasis on investing in system-wide changes; and
- Leverage and support community initiatives.

In order to accomplish the vision and goals, HOPE activities are focused on four strategic areas:

- Invest in primary care, prevention, and health promotion;
- Improve outcomes for high-need, high-cost individuals;
- Payment reform and alignment; and
- Support community driven initiatives to improve population health.

In addition, HOPE activities are supported by initiatives that enhance three foundational building blocks:

- Health information technology that drives transformation;
- Increase workforce capacity and flexibility; and
- Performance measurement and evaluation.”
react to once the agency is aligned internally around priorities and options. Engaging stakeholders can also help states make important implementation decisions. For instance, Washington State’s fully integrated managed care (FIMC) contract required MCOs to promote behavioral health integration through a variety of approaches, including training and incentives. The successful implementation hinged on understanding what role the MCOs and Accountable Communities of Health (ACHs) — regional coalitions with representatives from multiple sectors — would each play. Early engagement about who is best suited to assume specific roles, and what resources and expectations exist can assist both the state and managed care entities in preparing for PCI implementation.

States can also utilize requests for information (RFIs) or other equivalent processes to solicit input on their proposed or ongoing work in this space. RFIs often present opportunities for groups of stakeholders to come together to develop one unified set of recommendations, which can simplify the process for the state in addressing competing priorities across the stakeholder community. For example, Hawaii published an RFI on key delivery system reform goals to inform its managed care RFP, asking plans and providers the following open-ended question:

MQD is interested in promoting greater utilization of primary care and greater integration of behavioral health with primary care. Please describe payment models that would support these initiatives. In addition to payment, what support would providers need in order to achieve increased primary care utilization and integrated care?

Similarly, Pennsylvania published a RFI specifically focused on tools that help providers identify and address social needs, such as “existing individual or family needs assessments, methods of connecting individuals and families to community resources, and models for providing whole-person or whole-family case management.” In particular, the RFI included several questions related to technology tools that can help providers identify and address social needs. Building upon the responses to this RFI and related presentations, the state plans on developing a “statewide online resource and referral tool that will allow providers to connect patients seamlessly to appropriate resources.”
III. Design a PCI Strategy for Managed Care

After creating a vision for PCI, state agencies usually embark on designing their PCI strategy. Often, the bulk of this design work occurs in the context of managed care contracts and oversight mechanisms. The following are three steps related to designing a PCI strategy for Medicaid managed care:

1. **Maximize state procurement and contracting processes.** Integrate the state’s vision for PCI into RFPs and contract amendments;
2. **Leverage MCO functions.** Consider how an MCO may advance PCI through its traditional responsibilities; and
3. **Consider Design Options.** Explore how to design a PCI strategy in Medicaid managed care, balancing flexible versus prescriptive approaches and otherwise defining appropriate roles and responsibilities for the parties involved.

### 1. Maximize State Procurement and Contracting Processes

As part of the procurement process, state Medicaid agencies will issue RFPs for Medicaid MCOs. The RFP drafting process is an ideal time to define the next phase of a Medicaid managed care program and other large-scale reform efforts. A smart procurement strategy will identify the right partners for the state’s various delivery system and payment reform initiatives. The state can craft questions and an evaluation process that rewards not only stability and sophistication, but also innovation. Examples of RFP questions are included in **Section IV**.

Once a contract is awarded, states may also implement periodic contract amendments. The nature of state contracting processes often limits the extent to which states may expand a contractor’s scope of work, but amendments can nonetheless significantly advance PCI in a state. **Pennsylvania**, for example, recently published significant revisions to its contract relating to social determinants of health, modifying its community-based care management program and enhancing its requirements for PCMHs.10
2. Leverage MCO Functions

When designing a strategy, a state may first want to consider how traditional MCO functions can advance PCI. Mapping out these functions can help the state craft a cohesive strategy and integrate PCI priorities throughout a contract. Exhibit 3 provides examples of potential PCI-related MCO requirements and incentives, organized by common managed care contract sections.

Exhibit 3. Examples of PCI-Related Requirements and Incentives in Managed Care Contracts

<td>Requiring provider training and incentives related to PCI</td>
<td>Performance improvement projects that advance certain models of care (e.g., advanced PCMH models); integrate behavioral health; or advance strategies to address social needs</td>
<td>Carving in a wider scope of services (e.g., integration of behavioral and physical health)</td>
<td>Clarification on appropriate and inappropriate utilization management practices relating to telemedicine or models that integrate behavioral and physical health services</td>
<td>Requiring plans to integrate PCI-related strategies into VBP initiatives for providers (e.g., models that support addressing social needs)</td>
</tr>
<tr>
<td>Population health management</td>
<td>Screening for social and behavioral health needs, in coordination with primary care teams and other providers</td>
<td>Clarification on what may be included in the numerator of the medical loss ratio (e.g., care coordination, value-added services)</td>
<td>Time/distance standards for primary care providers</td>
<td>Clarifying flexibility to provide value-added and in-lieu of services that may address social or behavioral health needs</td>
<td>Alignment with non-Medicaid models (e.g., CPC+) or adoption of state models (e.g., Medicaid ACOs)</td>
<td></td>
</tr>
</tbody>
</table>

Section IV discusses these potential requirements and incentives in the context of four PCI priorities — addressing social needs, integrating behavioral health, enhancing team-based care, and using technology. The section uses options outlined in step three of this section, Consider Design Options, as an organizing framework.
3. Consider Design Options

To determine how MCOs should help the state achieve its PCI priorities, a state can weigh several design considerations, which are organized in this toolkit around the following options:

✔ Explore flexible versus prescriptive approaches;
✔ Define the roles and responsibilities of the state, primary care teams, and MCOs;
✔ Determine how to measure, monitor, and reward progress;
✔ Leverage payment reform to drive innovation; and
✔ Determine the need for additional investments.

This section describes these options and outlines several high-level design considerations for states. Section IV details unique considerations related to four PCI priorities — addressing social needs, integrating behavioral health, enhancing team-based care, and using technology — and uses these options as an organizing framework.

Explore Flexible Versus Prescriptive Approaches

When designing its PCI strategy, a state can craft flexible or prescriptive contract language — sometimes referred to as “hard” or “soft” requirements — to advance PCI in Medicaid managed care. Flexible language allows MCOs to design and test a variety of approaches to PCI, while prescriptive guidance is typically designed to reduce variation among managed care plans and encourage alignment. In selecting approaches, states may consider factors such as: (1) the degree to which MCOs have supported PCI and worked with other MCOs to do so; (2) state capacity to define and monitor PCI-related initiatives; (3) the number of contracted MCOs; and (4) the prevalence of a particular type of advanced care model in a state, such as through the Comprehensive Primary Care Initiative.12

Flexible approaches. In flexible approaches, states may define general expectations surrounding PCI, allowing MCOs to customize their approaches. States may prefer to remain flexible when they would like MCOs to experiment in a particular area and negotiate with providers as they see fit, such as with provider incentive programs. For example, Washington State requires its MCOs to promote behavioral health integration through education, training, and financial and nonfinancial incentives. States may also insert language into contracts and RFPs that is primarily anticipatory — a reference to expected, but yet to be defined, initiatives.

Prescriptive approaches. Alternatively, the state may require a specific model or approach, expecting the MCO to implement or advance the uptake of a program within state specifications. For example, the state may want to: present a unique, standardized Medicaid model (e.g., Medicaid ACOs); advance a Centers for Medicare & Medicaid Services model, such as Primary
Care First or Comprehensive Primary Care Plus; or implement a well-defined industry standard (e.g., NCQA’s patient-centered medical homes). States may choose to be prescriptive when seeking to encourage alignment or to avoid fractured or duplicative efforts in a competitive managed care environment. A prescriptive approach may be less preferable when there is little evidence on effectiveness of a particular model or where there is a wide variation in primary care capacity throughout the state.

Define Roles and Responsibilities
Managed care contracts must accommodate the differing roles and responsibilities of the state, plans, and providers, as well as differing levels of oversight. When including provisions regarding primary care, the state can define how the MCO will influence primary care through MCO functions — network management, quality assurance and performance improvement, payment, utilization management, and care management, among others. In defining roles and responsibilities, the state may: (1) develop common processes and infrastructure, if needed; and (2) provide guidance or standards for coordination between primary care teams and MCOs.

Develop Common Processes and Infrastructure. States can define common standards or develop shared resources for their Medicaid managed care programs in order to reduce fragmentation in a competitive Medicaid managed care market. For example, Louisiana, Kansas, North Carolina, and New Mexico designed or will design standardized health risk assessments or other screening tools that integrate questions on social needs in the context of their managed care programs. In addition to a social needs screening tool, North Carolina introduced several tools to aid its comprehensive “healthy opportunities” strategy, which has a distinct focus on social needs: a GIS-mapping service and a common closed-loop referral system. Tennessee developed a centralized care coordination tool for providers participating in the state’s PCMH program; this tool enables PCMHs to identify gaps in care and support care coordination by, among other things, providing admission, discharge, and transfer data from hospitals and emergency rooms, and allowing PCMHs to follow-up with patients and coordinate care post-discharge.

Provide Guidance or Standards for Coordination Between Primary Care Teams and MCOs. States may define how MCOs and primary care teams work together, especially on shared functions, such as care coordination and management. For example, Tier 3 Advanced Medical Homes will provide local care management as part of North Carolina’s new managed care program. The state’s RFP outlines how its new managed care plans must: (1) provide data to the medical homes; (2) calculate quality metrics; and (3) craft incentive payments. Similarly, individuals who are attributed to a Comprehensive Primary Care (CPC) Practice in Ohio receive all of their care management, including coordination of behavioral, physical, and social needs, from the CPC practice, and MCOs must support the CPCs with adequate data and reports. In another example, New Mexico’s MCOs may fully or partially delegate care coordination functions to primary care teams, such as administering a health risk assessment or coordinating referrals to community service providers. The state requires that full delegation occur in the context of a value-based payment, but allows MCOs and providers to craft other arrangements under a shared functions model. Pennsylvania’s community-based care management program requires MCOs to explore partnerships with providers, CBOs, and
community health workers, and to design more effective face-to-face care coordination programs, with a focus on: reducing preventable admissions and readmissions, addressing SDOH, and enhancing behavioral health and physical health coordination of services, among other categories.

**Determine How to Monitor, Measure, and Reward Progress**

As the mantra goes, what gets measured gets done. MCOs are likely to prioritize items for which they are held accountable. States can design ways to measure progress toward PCI. States may consider both system-level measures, as well as more targeted quality measures. These measures can then be integrated into MCO incentive and withhold arrangements, VBP arrangements with providers, and overall quality assessment and performance improvement strategies.

**Monitor Utilization of Primary Care Services.** States may consider measures that gauge use of primary care services — for example, well-child visit measures included in the CMS Child Core Set. In addition to these more standard quality measures, states have also implemented measures that seek to drive an increase in member enrollment with certain types of primary care teams, such as those affiliated with a PCMH or ACOs. For example, **Oregon** includes patient-centered primary care home enrollment as a coordinated care organization (CCO) incentive measure and ties that value to payment through the state’s Quality Pool.

**Measure Primary Care Spending in Relationship to Other Services.** States may consider measures that track overall MCO investment in primary care, relative to health care spending as a whole. This system-level approach may help the state track gaps in the overall primary care system and the effect of large-scale rebalancing efforts and investments in preventive, primary care. For example, **Oregon** will require its Medicaid CCOs to spend 12 percent of total health expenditures on primary care. The Patient-Centered Primary Care Collaborative, Milbank Memorial Fund, and the Robert Graham Center have been active thought partners in this field, designing methods by which primary care services are identified and included in primary care spending calculations, and promoting adoption of primary care spending measures by state legislatures and policymakers. By measuring investment in primary care, the state can design benchmarks that drive further investment into primary care through both MCO- and state-defined infrastructure and incentive programs.

**Incent Advanced Primary Care Strategies.** States may consider their goals, such as the integration of behavioral health and social services into primary care settings, and design “catalytic” measures that nudge MCOs and network providers toward that goal. These catalytic measures can be integrated into MCO incentive and withhold arrangements that reward the MCO for performance on key quality measures. In order to perform well on the catalytic measure, the MCO, in conjunction with its network providers, must advance PCI efforts. For example, states may consider a depression screening measure to advance behavioral health integration. In order to perform well on this measure, the primary care teams in the MCO’s network will likely need to improve processes for screening for and treating depression, perhaps with support and training from an MCO or coalition of MCOs. Similarly, states interested in advancing SDOH strategies may include direct measures on social needs screening, or indirect measures such as avoidable readmissions after hospitalization. At the MCO contract level, and at the level of
provider VBP, the incentive can drive PCI efforts that advance whole-person care approaches. In the absence of catalytic measures such as these, an MCO may largely ignore general directives in a contract regarding behavioral health and social service integration.

**Leverage Payment Reform to Drive Innovation**

Many states are using managed care contracts to advance VBP and may consider reinforcing a primary care focus within these requirements. To the extent that a state imposes a VBP benchmark (i.e., a required percentage of payments tied to VBP arrangements), states can define what types of primary care payments count toward the benchmark and may even weigh those models more heavily in the calculation. For example, **Massachusetts** establishes a VBP benchmark based on percentage of enrollees. For every one percent of enrollees assigned to an ACO, the state deems that value two percent for the purpose of the VBP benchmark.

States may also ask the MCO to discuss primary care in the context of its VBP strategic plans. For example, **Louisiana** requires its MCOs to submit a VBP strategic plan that includes estimated primary care expenditures and related VBP payment methodologies. Similarly, **North Carolina** requires its plans to integrate SDOH into their VBP plans.

States may also actively consider opportunities for alignment with other payment models, including Centers for Medicare and Medicaid Innovation models such as Comprehensive Primary Care Plus (CPC+) and its successor Primary Care First. Payer alignment may be particularly attractive to primary care teams, since they are likely affected by competing reporting requirements. **Ohio** requires MCOs to reimburse CPC+s the agreed upon per member per month (PMPM) payment for attributed members and any shared savings for meeting model requirements.

**Determine the Need for Additional Investments**

Given that advanced primary care models require PCPs to perform additional functions and develop supporting infrastructure, the state may assess the need for additional support. For example, the state may encourage the MCO to invest in PCMHs and other advanced primary care models. In this vein, **Oregon** will require MCOs to make infrastructure payments to its state-defined patient-centered primary care homes, and **Rhode Island** requires its MCOs to coordinate incentive payments for its accountable entities to enhance the system's capacity to address both social and behavioral health needs. Additional investments may also be needed to support state implementation of PCI strategies. States will also need to test strategies to keep MCOs accountable for the PCI goals in their contract — whether through reporting templates, contract enforcement, and/or continued convening and reporting.
IV. Advance Targeted Care Delivery Goals

After reflecting on its overall design strategy and broad-based goals relating to primary care, a state may want to consider how to use its managed care program to advance targeted care delivery goals. This section includes four PCI priorities:

1. **Identifying and addressing social needs**;
2. **Integrating behavioral health into primary care**;
3. **Enhancing team-based primary care approaches that better meet the community’s needs**; and
4. **Using technology to improve access to care**.

Each PCI priority includes unique design considerations, organized by key options outlined in the previous section.

In addition to detailing design considerations, each PCI priority includes **state approaches**, **sample contract and RFP language**, and **measurement and payment strategies**. While this toolkit does not seek to define the right path, it can provide states with a range of potential approaches.
1. Identifying and Addressing Social Needs

SDOH are conditions in the places where people live, learn, work, and play.40 For individual patients, social needs, such as food or housing insecurity, can have a substantial effect on health.

State Medicaid agencies can use managed care contracting levers to focus on both population-level SDOH and individual-level social needs. At the population level, states can advance targeted, coordinated investments in local communities, and encourage MCOs to design interventions to reduce health disparities by using and analyzing social needs data. At the individual patient level, states can consider defining how primary care teams (PCTs) and MCOs: (1) screen for health-related social needs; (2) address identified needs through referral and partnerships with CBOs, as well as direct investments; and (3) advance whole-person approaches to care coordination and management. Across this spectrum of activities, states may define appropriate coordination, collaboration, and integration goals for both PCTs and MCOs.41

**Design Considerations**

Both PCTs and MCOs have an important role to play in identifying and addressing social needs and broader SDOH.42 States may develop a comprehensive strategy that addresses SDOH throughout a managed care contract. For example, the state may integrate a focus on social needs into contract sections relating to: training programs for network providers; care coordination and management; quality assurance and performance improvement; VBP; additional services such as value-added and in lieu of services; and MCO payment incentives. The state may also consider ways to develop a common infrastructure and tools that can enable both PCTs and MCOs to better identify and address social needs.

Following are considerations to inform state efforts in developing an SDOH strategy:

### ADDRESSING SOCIAL NEEDS:

**Design Considerations Summary**

**Explore flexible versus prescriptive approaches.**
- Will the state encourage, incent, or require PCTs or MCOs to screen for social needs? If so: (a) what social needs should be screened for; (b) what type of screening tool should be used; (c) who should be screened; and (d) how should social needs information be documented and reported?

**How should PCTs or MCOs connect beneficiaries to, or invest in, community resources?**
- Will the state mandate a particular tool (e.g., community resource referral platform) or method (e.g., warm hand-off)? Will the state require a certain level of MCO investment, or particular focus area (e.g., housing, food insecurity)?

**Define the roles/responsibilities of the state, primary care teams, and MCOs.**
- Who should screen for social needs?
- Who will define priorities for SDOH-related work? How can they solicit input from local communities to determine priority interventions and investments?
- How can the state ensure that its planned approach will enhance, and not detract from, the capacity of the community to address SDOH?

**Determine how to measure, monitor, and reward progress.**
- How will the state measure progress and hold MCOs accountable for implementing a SDOH strategy?
- Will the state require or incent MCOs to partner with CBOs, or invest in certain interventions?

**Leverage payment reform to drive innovation.**
- Will the state require MCOs to integrate social needs partnerships and related metrics into VBP requirements?

**Determine the need for additional investments.**
- What infrastructure and investments are needed to support this work? How will payment models and state investment and leadership support this infrastructure and investment?
Do PCTs and MCOs in the state already screen for social needs?

First, the state may want to assess the degree to which: (1) PCTs participate in a particular model that includes social needs screening, such as Accountable Health Communities, Pathways Community HUB, or CPC+; and (2) MCOs integrate questions on social needs into their health risk assessments and other screeners. If PCTs and MCOs are already doing this work, states may prefer to be less prescriptive, outlining only general guidelines and avoiding potential conflicts with established systems and processes.

Who should screen for social needs?

Both MCOs and PCTs can integrate social needs screening into their standard processes, and each approach has benefits. Individual MCOs are responsible for wider swaths of the Medicaid population and have the resources to systematize the collection of social needs data through health risk assessments and other screeners. However, many MCOs rely on telephonic care coordination processes that may not be as amendable to asking sensitive questions on social needs. By contrast, PCTs can likely develop a deeper, face-to-face connection with the patient, which can yield more complete and honest responses to social needs screening questions. The PCT, however, may not always have the resources to aggregate and analyze data. Building on these respective strengths, states can explore ways to encourage MCOs to partner with PCTs on, and pay PCTs for, care coordination functions that involve screening for social needs — avoiding unnecessary duplication where possible. In both MCOs and PCTs, community health workers can assist with these functions.

Managed Care Procurement

Following is sample state managed care request for proposal language related to social determinants of health:

Minnesota. “Describe how the Responder will commit resources towards improving population health. Describe how Responder will proactively coordinate with counties and others to address social determinants of health for customers. Describe how providers will be encouraged / incentivized to reach preventative goals for cost saving outcomes.”

Oregon. “Does Applicant currently have performance milestones and/or metrics in place related to social determinants of health and health equity? These milestones/metrics may be at the plan level or Provider level. If yes, please describe.”

Virginia.

- “How are social determinants assessed by your organization?”
- “What social determinants data elements are currently captured for your member population, and from what sources?”
- “What future data, data source(s), or technology enhancements are planned to capture more social determinants information?”
- “How does the Offeror partner with health care and social service providers to address social determinants? Describe any alternative payment arrangements that include social determinants reporting or intervention as a factor of payment.”
- “Describe your organizations ideas for best practices that should be included in [a] pilot program related to addressing nutritional insufficiency, including outreach and coordination with schools, community resources (including food resources), primary care physicians and/or other social services.”
Who should be screened?
States may determine that only certain populations require a full social needs screening — for example, those who require more intensive care coordination because of complex needs or who have screened positively to a preliminary, shorter screen. However, given the prevalence of health-related social needs among Medicaid beneficiaries, gaps in screening practices may contribute to missed opportunities to determine appropriate diagnoses and approaches to care.

What data does the state need, and what data does the state have?
The state may choose to allow an MCO to collect social needs information in the way it sees fit. At other times, the state may be interested in collecting standardized data from the plans to inform policy planning or a formal pilot evaluation. In either scenario, the state may assess what social needs information can be aggregated from other sources that can assist the state with its goals, and otherwise supplement MCO and PCT screening practices.

What needs should be screened for, and what type of screening tool should be used?
Using current MCO/PCT screening practices and the state’s data needs as starting points, states may consider whether it will require a standardized screening tool or provide general guidelines on an appropriate tool (e.g., a preference for validated questions or for priority social needs, such as housing and food insecurity).

How will identified social needs be documented?
States may want to ensure that both MCOs and PCTs can access and supplement social needs screening information. States may defer to MCOs to define appropriate standards for social needs documentation, or encourage a particular approach, such as the use of Z Codes in the ICD-10 set.

Managed Care Contract Excerpts
Following is sample state managed care contract language related to social determinants of health:

Louisiana.49 [The contractor shall]:
- “Offer evidence-based practices that have a demonstrated ability to address SDOH and reduce health disparities […]”
- “Collaborate with its high-volume primary care practices to develop, promote and implement targeted evidence-based practice.”
- “Measure and report semi-annually to LDH on the effectiveness of its evidence-based interventions to reduce health disparities. Minimum reporting requirements include data on self-reported race, ethnicity, language, housing, food, transportation, employment and safety needs, care management model utilized, risk stratification criteria highlighting priority populations, and targets for engagement and outcomes stratified by priority subgroup […]”

Oregon.50 [Contractor must, through its Community Advisory Council:]
- “Include SDOH and Health Equity partners and organizations, counties, traditional health workers, and tribes in development of the Community Health Assessment (CHA) and Community Health Improvement Plan (CHP).”
- “[Develop] ”shared CHA and CHP priorities and strategies with local public health authorities, nonprofit hospitals, […] other coordinated care organizations […], and […] federally recognized tribe[s…”]

Pennsylvania.51 The [MCO] will ensure the PCMH provider:
- “Will deploy a community-based care management team […] that connect[s] individuals as needed to community resources and social support services through ‘warm hand off’ referrals for assistance with problems such as food insecurity and housing instability:”
- “Will […] submit ICD-10 diagnostic codes for all patients”
How should PCTs and MCOs connect beneficiaries to community resources? Who should be responsible for creating the necessary infrastructure to support this work?

Under federal rules, MCOs must coordinate the services they deliver with those available through community and social support providers. States may build upon this general obligation to require the MCO to refer enrollees to community resources, or to advance particular types of referral in partnership with PCTs (e.g., “warm handoffs”). The state may also require the MCO to: (1) maintain an up-to-date list of community resources; (2) use specific referral pathways, such as 211; (3) implement closed-loop referral processes, whereby the MCO or PCP tracks whether a beneficiary actually received a service; or (4) facilitate formal partnerships among CBOs, MCOs, and providers. The state may also introduce a common resource for MCOs and PCTs that can facilitate this process, as North Carolina has done with its NCCARE360 community resource referral platform.

Who will define priorities for SDOH-related work?

States may direct MCOs to: (1) collaborate with PCTs on evidence-based interventions relating to SDOH; (2) target those efforts to a particular state priority area, such as food or housing insecurity; or (3) identify interventions that are relevant to a particular community, as identified through data analysis or stakeholder engagement. Additionally, the state may present its specific SDOH requirements in the context of a particular health disparity, such as maternal mortality or low birth weight.

Will the state require or incent MCOs to partner with CBOs, or invest in certain interventions?

To support care coordination and craft an effective SDOH strategy, MCOs can learn from, partner with, and sometimes fund CBOs that address the social needs of members. The state may direct MCOs to enter into formal partnerships with CBOs, and integrate PCTs into these partnerships and intervention programs, to the extent possible. The state may also encourage, incent, or require MCO investment in local communities, as in Arizona, North Carolina, and Oregon. The state may also define a priority area for investment, such as housing.

How will MCOs or PCTs solicit input from local communities to determine priority interventions and investments?

States may define expectations around consumer and community perspectives, or require a specific structure or process to capture this input, such as Oregon’s community advisory councils and coordinated community health assessments.

How can the state ensure that its planned approach will enhance, and not detract from, the capacity of the community to address SDOH?

States may consider how to advance MCO-CBO partnerships, and avoid unintended consequences arising from MCO contract requirements. For example, states may encourage MCOs to contract with and fund existing community health worker programs with strong connections to local communities, as opposed to merely strengthening and staffing in-house MCO activities. The state may also encourage MCOs to design programs that help CBOs build capacity to address an uptick in referrals from MCOs, such as through upfront working capital or performance-based incentives (See VBP requirements in New York and Oregon).
How will the state measure progress and hold MCOs accountable for implementing an SDOH strategy?

States may implement specific SDOH requirements in the context of: (1) a larger health equity initiative; (2) a targeted performance improvement project; (3) a VBP initiative; (4) a withhold or incentive arrangement; (5) an MCO care management requirements; or (6) a § 1115 demonstration project or pilot. Each of these approaches will have its own data and monitoring needs, as well as its own relationship to MCO or provider payment. The state may choose to focus on more clinical indicators, such as emergency department utilization or readmission rates. Alternatively, the state may choose to track social needs screening rates, or more subjective measures such as “healthy days” or self-rated health status.58

State Approaches

States may take various approaches to identifying and addressing social needs in Medicaid programs. The approach may be flexible, defining state expectations and allowing space for MCO customization, or prescriptive, advancing state standardization and MCO implementation of a standardized model or tool. Following are specific state examples for identifying and addressing social needs for Medicaid populations.

<table>
<thead>
<tr>
<th>Flexible</th>
<th>Prescriptive</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Approaches to Identifying Social Needs</strong></td>
<td><strong>Kansas, 60 Louisiana, 61 and North Carolina</strong>62 require MCOs to use state-developed social needs screening questions.</td>
</tr>
<tr>
<td><strong>Pennsylvania</strong> requires MCOs to ensure that its patient-centered medical homes complete an SDOH assessment using a “nationally recognized tool.” MCO case/disease and health management programs must “include collaboration with the Department to develop, adopt and disseminate a Social Determinants of Health assessment tool.”65</td>
<td></td>
</tr>
<tr>
<td><strong>Approaches to Addressing Social Needs</strong></td>
<td><strong>North Carolina</strong> requires MCOs to use a community resource referral platform called NCCARE 360.63 The system will enable health care and human service providers to send and receive secure electronic referrals, share client information, and track outcomes.</td>
</tr>
<tr>
<td><strong>Michigan</strong>63 and Louisiana64 require its MCOs to collaborate with its high-volume primary care practices to “develop, promote, and implement targeted evidence-based interventions” that can address SDOH and health disparities.</td>
<td><strong>Virginia</strong> requires MCOs to coordinate with the state on a pilot program addressing nutritional insufficiency, with a particular focus on children.67</td>
</tr>
<tr>
<td><strong>Pennsylvania</strong> requires MCOs to design a community-based care management program and team, which can include provider partners. MCOs must implement at least one rapid cycle quality improvement pilot program, implemented with CBOs and focused on improving health outcomes and addressing social determinants of health.66</td>
<td></td>
</tr>
</tbody>
</table>
**Measurement and Payment**

Measurement and payment approaches relating to SDOH are relatively nascent, but states are beginning to integrate SDOH measures and incentives into their Medicaid programs, such as through ACO quality measures, VBP initiatives, and MCO incentive and withhold arrangements. Following are examples of state measurement and payment strategies related to social needs.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Accountable Care Organization Measures</strong></td>
<td></td>
</tr>
<tr>
<td>Massachusetts</td>
<td><strong>Health-Related Social Needs Screening</strong>[^68] - Percentage of members who were screened for health-related social needs in the measurement year.</td>
</tr>
<tr>
<td>Minnesota</td>
<td><strong>Health Equity Measure</strong>[^69] - During contract discussions, Minnesota’s Integrated Health Partnership (IHP) attributed population will be examined to determine its predominant health disparities using DHS data as well as information provided by the IHP. The IHP will be required to propose an intervention and health equity measures tied to this intervention that are intended to reduce health disparities among the IHP’s population.</td>
</tr>
<tr>
<td>Rhode Island</td>
<td><strong>Social Determinants of Health Screening</strong>[^70] - The percentage of attributed patients who were screened for SDOH using a state-approved screening tool, where the Accountable Entity has documented the screening and results.</td>
</tr>
<tr>
<td>Rhode Island</td>
<td><strong>Self-Reported Health Status - Adults</strong>[^71] - The percentage of attributed patients who completed a Self-Reported Health Status screening, where the AE has documented the screening and the results.</td>
</tr>
<tr>
<td><strong>Value-Based Payment Requirements</strong></td>
<td></td>
</tr>
<tr>
<td>New York[^72]</td>
<td>New York requires certain advanced VBP arrangements to include at least one SDOH intervention and one partnership with a CBO. MCOs must provide a funding advance that assists the provider or CBO implement the intervention.</td>
</tr>
<tr>
<td>North Carolina[^73]</td>
<td>North Carolina will require plans to “submit a written plan […] that indicates how it will incorporate addressing Opportunities for Health [activities relating to health-related social needs] into its VBP strategy to align financial incentives and accountability around total cost of care and overall health outcomes.”</td>
</tr>
<tr>
<td>Oregon[^74]</td>
<td>Oregon requires CCOs to design payment arrangements that reward participating providers for their role in achieving MCO incentive metrics under the state’s Quality Pool and Challenge pool. CCOs must:</td>
</tr>
<tr>
<td></td>
<td>- “offer correlative arrangements with Participating Providers (including Social Determinants of Health &amp; Health Equity (SDOH-HE) partners, public health partners, and other health-related services providers as appropriate), providing monetary incentive payment arrangements with Providers that reflect priorities which align with the Quality Pool program for achieving the outcome and quality objectives.”</td>
</tr>
<tr>
<td></td>
<td>- “create a distribution plan for Quality Pool and Challenge Pool earnings. The plan should include [among other factors] […] an overview of the methodology and/or strategy used to distribute quality pool earnings to participating providers, including SDOH-HE and public health partners, that provides information related to the contractor’s process of evaluating the contributions of participating providers and connecting those evaluations to distribution of funds.”</td>
</tr>
</tbody>
</table>
### MCO Withhold and Incentive Arrangements

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Michigan**<sup>75</sup> | Michigan has three MCO pay for performance (P4P) programs relating to SDOH; in each program, the MCO submits a baseline analysis, intervention proposal, and intervention report: **Pay for Performance on Population Health and Health Equity.** The state’s managed care contract defines a “population health management intervention” relating generally to social determinants of health and notes a particular state interest in housing.  
**Low Birth Weight (LBW) Project.** “For FY 2018, the goal is to involve the Medicaid Health Plans, existing home visiting programs, and community health worker programs to design and implement a meaningful P4P project. In order to improve infant health outcomes, the initiative will address documented health disparities and health inequities with particular focus on reducing the LBW-CH rate. The activities in FY18 will include identifying evidence-based, integrated models that address LBW through management of medical and social determinants of health. They will also incorporate parties who focus on maternity care to identify and implement models of choice through collaborative processes. The purpose of the LBW project model will be to encourage active participation by using data analysis to identify partnerships and risk factors associated with LBW (including social determinants of health). The evidence-based intervention will utilize a three-prong approach: [a] Preconception, [b] Timeliness of prenatal care, [c] Post-partum care”  
**Emergency Department Utilization.** “Emergency Department (ED) utilization provides a snapshot about quality and access issues faced by Michigan Medicaid beneficiaries and their surrounding community. Health Plans will explore and develop innovative initiatives to improve the effectiveness and performance of ED utilization. Interventions should focus on the reduction and/or elimination of ED visits related to A) behavioral health, or B) substance use disorder treatment, or C) dental problems. They should also emphasize the clinical and non-clinical aspects of a member’s socio-logical system. Goals may include improvement in health outcomes; enhanced coordination of services and partnering with non-traditional healthcare providers; and increased cost-effectiveness with a major effort to lower inappropriate ED Utilization in the Michigan Medicaid Managed Care population. “ |
| **Oregon**<sup>76</sup> | SDOH and Health Equity Bonus Fund. Oregon’s most recent RFP notes that the state “intends to establish a two-year incentive arrangement — the SDOH-HE Capacity-Building Bonus Fund (“SDOH-HE Bonus Fund”) — to offer monetary bonus payments above and beyond the capitation rate to contractors that meet SDOH-HE-related performance milestones and metrics.” These milestones and metrics have yet to be defined. CCOs must submit a plan for how Contractor intends to direct its SDOH-HE spending for SDOH-HE that includes an evaluation plan and budget proposal. The CCO must also enter into formal written arrangements with SDOH-HE partners. |
2. Integrating Behavioral Health Care

Across the United States, behavioral health conditions — including mental illness and substance use disorders — are often underdiagnosed and treatment is delayed. While behavioral health care is typically delivered separately from primary care, there is growing consensus that behavioral health should be integrated into primary care to help facilitate earlier diagnosis and treatment. This section outlines strategies and considerations for integrating behavioral health into primary care for states operating in a Medicaid managed care environment, including a variety of activities and incentive arrangements.

Design Considerations

✔ How will the state define “behavioral health integration” in primary care?

At the broadest level, behavioral health integration can describe any situation in which behavioral health and medical providers work together. Numerous overlapping terms have been used to describe behavioral health integration, which can create confusion and potentially inhibit implementation of effective interventions. Increasingly, health care experts have supported the idea that integration occurs along a continuum. The Center for Integrated Health Solutions, jointly funded by the Substance Abuse and Mental Health Services Administration (SAMHSA) and Health Resources and Services Administration (HRSA), developed a widely adopted framework ranging from minimal collaboration to co-located care to fully integrated care. Likewise, some experts advocate for distinguishing between collaborative care, which involves behavioral health working with primary care, and integrated care, which involves behavioral health working within and as part of primary care.

INTEGRATING BEHAVIORAL HEALTH CARE: Design Considerations Summary

Explore flexible versus prescriptive approaches.
✔ How will behavioral health integration be defined in MCO contracts — in a specific way that promotes uniform care delivery approaches, or more broadly to allow flexibility?

How, if at all, will the state define what types of behavioral health screenings should be integrated into primary care?

Which existing care models could be used to advance behavioral health integration?

Define the roles/responsibilities of the state, primary care teams, and MCOs.
✔ How will the state minimize barriers to integrated care?

Which providers are expected to participate in integration activities?

To what extent will the state encourage or require MCOs to work together on integration activities?

Determine how to measure, monitor, and reward progress.
✔ What financial or non-financial incentives will the state use to encourage uptake of integration among MCOs and providers?

How will progress toward integration be monitored, and by whom — centralized via the state, or delegated to health plans?

Leverage payment reform to drive innovation.
✔ How, if at all, will the state dictate how MCOs should pay providers for integrated care (recognizing that many activities related to integrated care, such as provider consultations, are not typically reimbursed under a fee-for-service (FFS) model)?

To what extent can the state align payment approaches with other payment initiatives that incentivize behavioral health (e.g., CPC+)?

Determine the need for additional investments.
✔ What additional funding may be needed to ensure adequate reimbursement for new activities, staffing, or infrastructure deployed by MCOs and/or providers?

To what extent might states either develop or require MCOs to provide shared supports for smaller primary care practices that are not independently able to undertake more sophisticated integration activities?
States may choose to define behavioral health integration in primary care differently based on their priorities and existing health plan and provider market, as well as population needs. For example, patient populations at low risk for complex behavioral health conditions might best be served in coordinated primary care and mental health practices where collaboration is facilitated by a care manager. Patients with serious mental illness or active substance use disorder (SUD) and multiple medical problems seen in traditional community mental health centers may need co-located care within partially or fully integrated provider practices to improve their outcomes.

For example, Oregon requires its health plans to “understand and acknowledge” that integrated care spans a continuum ranging from communication to coordination to co-management to co-location to the fully integrated Patient-Centered Primary Care Home. Louisiana defines behavioral health integration “activities” for its Medicaid MCOs, such as: incentivizing providers to co-locate physical and behavioral health services; providing support for PCPs who screen for behavioral health issues and treat mild to moderate cases; and ensuring collaboration and communication among physical and behavioral health providers.

✔ Which providers are expected to participate in behavioral health integration activities?

It is important to consider the providers to whom behavioral health integration expectations will apply. For example, will integration requirements apply only to particular providers or provider organizations, such as ACOs, PCMHs, or high-volume PCPs, or will they apply to PCPs in general? States with well-established PCMH programs may opt to define standards for behavioral health integration within those programs (see Section V. Three State Approaches to Patient-Centered Medical Homes), and then incent or require plans to contract with those providers. Other states may outline expectations for MCOs to increase the level of integration activities occurring across the continuum for all primary care and behavioral health providers.

Managed Care Procurement

Following is sample state managed care RFP language related to integrated behavioral health services:

**Arizona.** “To accelerate the focus on integration at the provider level, describe the Offeror’s specific and detailed value-based strategies that align incentives between providers and the Offeror in order to reduce fragmentation and improve member outcomes. The Offeror’s response must address value-based integration strategies for each of the following: [a.] integrated providers, [b.] behavioral health only providers, and [c.] physical health only providers.”

**Kansas.** “Contractor(s) shall provide a detailed description in its proposal detailing [a.] what type of clinical support it will offer to Providers treating Behavioral Health conditions (including but not limited to depression, anxiety and addiction) in the Primary Care setting. [b.] How it will promote and support Primary Care based Behavioral Health in pediatric and adult populations; what best practices and recommended protocols it will use to support the integration of medical and Behavioral Health care; and what materials and tools it will utilize in order to engage Members and Providers to improve integration.”

**Oregon.** “Applicant must identify and address billing system and policy barriers to integration that prevent Behavioral Health Provider billing from a physical health setting. Applicant will develop payment methodologies to reimburse for Warm Handoffs, impromptu consultations, integrated care management services and all services for evidence-based treatments.”
States interested in broadly scaling integrated care within a wide range of primary care practices may want to consider moving away from an emphasis on a particular care model to definitions of functions that are more broadly applicable to a range of providers (e.g., those that do not require hiring new staff). Such states may choose to reference the eight common elements and minimum standards of integrated care developed by the Washington State Bree Collaborative.

What are managed care organization requirements and responsibilities for integrated primary care?

States may take many different approaches to promote integration through Medicaid MCO contracts. Given that states have different populations, patient needs, and provider/health plan markets, there is no “right” way to do this work. States may choose to be firm in their expectations regarding a precise standard by which to measure performance, or instead express interest in achieving a particular outcome (e.g., co-located providers) accompanied by an incentive, such as a bonus or favorable auto-enrollment policies. New Hampshire requires MCOs to ensure that physical and behavioral health providers offer co-located or integrated care as defined in SAMHSA’s Six Levels of Collaboration/Integration or the Collaborative Care Model to the extent feasible, and to provide annual reports to the state on continued progression toward integration. Alternatively, Washington State encourages “behavioral health-medical integration,” but provides MCOs with more flexibility to determine exactly what integration will look like. States might also choose to design and implement standardized statewide programs that advance behavioral health integration within primary care at the state-level, and then require or incent plans to participate in those.

Managed Care Contract Excerpts

Following is sample state managed care contract language related integrating behavioral health services:

**New Hampshire.** “The MCO shall ensure physical and behavioral health Providers provide co-located or Integrated Care as defined in the Substance Abuse and Mental Health Services Administration’s (SAMHSA’s) Six Levels of Collaboration/Integration or the Collaborative Care Model to the maximum extent feasible.”

“[T]he MCO shall include in its Behavioral Health Strategy Plan and Report efforts towards continued progression of the SAMHSA Integration Framework at all contracted primary and behavioral health Providers.”

**Louisiana.** The PCP shall provide basic behavioral health services [defined term] and refer the enrollee(s) to the appropriate health care specialist as deemed necessary for specialized behavioral health services. The Contractor shall ensure that network PCPs fulfill their responsibilities including, but not limited to […] conducting screens for common behavioral issues, including, but not limited to, depression, anxiety, trauma/adverse childhood experiences (ACES), and substance use, early detection, identification of developmental disorders/delays, social-emotional health, and SDOH to determine whether the enrollee needs behavioral health services.”

**Washington State.** “The Contractor shall promote behavioral health-medical integration through education, training, financial, and nonfinancial incentives…including but not limited to [a] increased screening, identification, and referral for behavioral health conditions that commonly occur in primary care settings [; and b.] development of collaborative care models and co-location of primary care and behavioral health providers.”
How, if at all, have states defined what types of screenings should be integrated into primary care?

Many integrated care models involve systematic screening of a target population to proactively identify patients in need of care. Integrated primary care may involve different types of behavioral health screening, including screenings for mental health and/or SUD. Some states require MCOs to use a particular screening approach within primary care and/or train PCPs on implementation of that screening tool. Minnesota, for example, promotes Screening, Brief Intervention, and Referral to Treatment (SBIRT) for SUD, and allows plans and providers to choose among state-approved screening tools. In Oregon, SBIRT is a covered benefit for all Medicaid patients and for a wide range of provider types. Depression screening is another common integration activity within primary care, with some states similarly allowing plans and providers to choose among validated screening tools and others requiring use of a particular tool, such as the Patient Health Questionnaire-9. States may also explicitly require MCOs to reimburse PCPs for behavioral health screening activity, as Michigan has done. Additionally, states may wish to clarify appropriate screenings for children in the context of early, periodic, and diagnostic services. For example, in its 2019 RFP, Oregon asks potential respondents to describe how it will ensure that periodic social-emotional screening for all children birth through five years is conducted in the primary care setting.

How will the state minimize barriers to integrated care?

In order to minimize barriers to integrated care, states can: (1) stipulate that MCOs assess and maintain billing approaches and other policies conducive to integrated care; and (2) assess their own policies, laws, and regulations to assess whether any may be unintentionally impeding progress toward integration. At the MCO-level, Virginia requires that its contracted health plans demonstrate the ability to cover specialty consultant services (e.g., telepsychiatry) to interested PCPs and contract with network behavioral health providers that can provide assessments and other services via telehealth, as needed. Oregon asks potential contractors to identify and address any billing and policy barriers to integration, and to develop payment approaches to reimburse for historically unpaid activities, such as care managers or provider consultations.

States can also solicit stakeholder feedback and conduct research on their own policies around billing to ensure they are conducive with the provision of collaborative and integrated care. For example, does the state have any same-day billing policies that impede integration? The 21st Century Cures Act recognizes this potential barrier to behavioral health integration, suggesting that Title XIX of the Social Security Act does not prohibit separate payment for a “mental health service furnished to the individual by a provider at a facility on the same day a primary care service is furnished to such individual by such provider (or another provider) at the facility.”

How, if at all, will the state dictate how MCOs should pay providers for integrated care?

Integrating behavioral health into primary care has been widely demonstrated to improve quality and reduce costs, particularly for the Collaborative Care Model (see Care Delivery Models for more details on this model). However, uncertainty about implementation and maintenance costs, and lack of a clear pathway for reimbursement, has hindered
more widespread adoption. A study of integrated team-based care approaches found that integrated practices generate $115 per patient less annually, on average, under traditional FFS payment methods. This means that, from a business perspective, provider practices confront financial disincentives for integrating care unless the payment model is changed. In general, approaches that can be used to pay for integrated care include: (1) new fee-for-services billing codes (e.g., Washington State’s Collaborative Care Model codes); (2) care management payments (e.g., New York’s case rates for qualified Collaborative Care Model providers); (3) bundled payments (e.g., Minnesota’s Diamond model); and (4) primary care capitation (e.g., Rhode Island’s primary care capitation framework).

States may consider how, if at all, to dictate the way MCOs should pay for integrated care. A state may require MCOs to use a particular payment model or pay enhanced rates for providers demonstrating certain capabilities. Alternatively, a state may defer to the plan to develop payment methodologies to reimburse for historically unfunded services, such as provider consultations or integrated care management. States may be tempted to rely on broad VBP targets in Medicaid managed care contracts to spur new payment models for integrated care. Early evidence suggests, however, that use of broad VBP targets or benchmarks typically does not translate into widespread use of VBP for smaller or independent providers, including PCPs and behavioral health providers. Additionally, states may want to consider how and whether to align payment models for PCPs participating in related federal initiatives, such as CPC+ or Primary Care First. For example, CPC+ has explicit requirements for participating practices to integrate behavioral health services, selecting from one of two different care delivery options: Care Management for Mental Illness or Primary Care Behaviorist (see Care Delivery Models for more details).

How do you measure and reward performance related to integration?

States may create financial incentives for health plans as well as providers that meet certain integration benchmarks and milestones, such as behavioral health services constituting a certain percentage of total claims for a primary care practice or demonstrating capacity to exchange information across providers through an electronic health record system. States might also require health plans to report on integrated care progress, similar to how New Hampshire requires its MCOs to report on continued progression of integration efforts for all contracted primary and behavioral health providers. States may also choose to assume some centralized responsibility for measuring and rewarding performance related to integration. For example, Washington State conducts an annual survey of providers related to value-based purchasing that includes questions about integration activities. States can also rely on national accreditation bodies to help identify practices that have demonstrated the ability to provide integrated care, such as via the National Committee of Quality Assurance’s PCMH Distinction in Behavioral Health Integration.

To what extent will you encourage or require MCO collaboration on behavioral health integration activities?

States operating in a Medicaid managed care environment may want to consider standardizing certain aspects of their integration efforts in order to reduce burden on providers and create seamless access to integrated care from the beneficiary’s perspective. For example, Pennsylvania’s Telephonic Psychiatric Consultation Service Program increases the
availability of peer-to-peer child psychiatry consultation teams to PCPs and other prescribers of psychotropic medications for children. The state’s MCOs are required to contract with a telephonic psychiatric consultation team that provides real-time telephonic consultative services to PCPs and prescribers. Pennsylvania required the physical and behavioral health MCOs to work together to collaboratively choose one psychiatric consultation team for each region. States might require MCOs to work together in a similar way to help fund or otherwise provide shared supports for smaller primary care practices that are not independently able to undertake more sophisticated integration activities.

**Care Delivery Models**

For states contemplating how to incent integration of behavioral health in primary care via Medicaid managed care, knowledge of existing care models serves to provide examples of off-the-shelf approaches so that states, health plans, and providers do not have to “start from scratch” in developing approaches. Below is a list of selected behavioral health integration models, roughly organized along the SAMHSA-HRSA Continuum of Physical and Behavioral Health Integration (Exhibit 5):

**Exhibit 5. Continuum of Physical and Behavioral Health Care Integration**

<table>
<thead>
<tr>
<th>COORDINATED CARE</th>
<th>CO-LOCATED CARE</th>
<th>INTEGRATED CARE</th>
</tr>

<td>Health Homes</td>
<td>System-level Integration</td>
</tr>
</tbody>
</table>

**Care Delivery Model Examples**

**Screening**

- **Screening, Brief Intervention, and Referral to Treatment (SBIRT)** is an evidence-based practice used to identify, reduce, and prevent problematic use, abuse, and dependence on alcohol and illicit drugs. SBIRT enables PCPs to systematically screen and assist people who may not be seeking help for a substance use problem, but whose drinking or drug use may cause or complicate their ability to successfully handle health, work, or family issues. States may cover SBIRT services as a Medicaid State Plan service.

**Consultation**

- **Massachusetts Child Psychiatry Access Project** provides quick access to psychiatric consultation and facilitates referrals for accessing ongoing behavioral health care. It encourages and supports PCPs integrating behavioral health resources into their practices. Many states have implemented similar programs.

- **Project ECHO** is a telehealth mentoring model that enhances workforce capacity in underserved areas by providing community-based primary care teams with the evidence-based knowledge to manage patients with complex conditions.
The Extension for Community Healthcare Outcomes (ECHO) model provides an opportunity to promote expansion of access to treatment for a broad range of mental health and substance use disorders, particularly in underserved areas.118,119

- **Vermont’s Hub and Spoke Model** is used to expand access to medication assisted treatment for substance use disorders. Under the model, nine regional opioid treatment facility “hubs” offer daily support for complex addictions, while 75 “spokes” or primary care practices offer ongoing opioid use disorder treatment.

### Navigation

- **Collaborative Care Model (CoCM)**,121 considered an advanced form of coordinated care, is an evidence-based approach for integrating physical and behavioral health services within PCMH or other primary-care settings.122 It enhances routine primary care by adding two key services: (1) care management support for patients receiving behavioral health treatment; and (2) regular psychiatric inter-specialty consultation to the primary care team, particularly regarding patients whose conditions are not improving.123 CoCM is recognized as effective in treating a wide range of behavioral health disorders, including depression, anxiety, and SUD.

- **Care Management for Mental Illness** is one of the foundation behavioral health integration strategies under Comprehensive Primary Care Plus (CPC+). Selected CPC+ practices must develop capabilities using at least one foundational strategy. This strategy includes offering proactive, relationship-based care management, with specific attention to care management of the mental health condition (e.g., major depressive disorder/dysthymia, generalized anxiety disorder, and panic disorder).

### Co-Location

- **Primary Care Behaviorist Model** is one of the foundational behavioral health integration strategies under CPC+. Selected CPC+ practices must develop capabilities using at least one foundational strategy. This strategy includes warm handoffs to a co-located behavioral health professional to address mental illness in the primary care setting and behavioral strategies for management of chronic general medical illnesses, and to facilitate specialty care engagement for serious mental illness.

### Health Homes

- **Medicaid Health Homes**, made possible under Section 2703 of the Affordable Care Act, is designed to enhance coordination and continuity of care for Medicaid beneficiaries with complex chronic conditions across various care types and settings and to provide a “cost-effective, longitudinal ‘home’ to facilitate access to an inter-disciplinary array of medical care, behavioral health care, and community-based social services and supports for both children and adults with chronic conditions.”124 As noted in a Kaiser Family Foundation brief, “the comprehensive nature of health home services and the holistic approach to care place health homes further ‘east’ on the . . . integration continuum.”125

### System-Level Integration

- **Oregon’s “Fully Integrated” Patient-Centered Primary Care Home (PCPCH)**, integrated into Oregon Health Authority’s broader CCO program, reaches the highest level of behavioral health integration. PCPCHs must provide integrated behavioral health services, including population-based, same-day consultations by behavioral health providers.126 Further, physical and behavioral health providers must also use the same medical record system and participate in collaborative treatment planning and co-management via case conferences, consults, pre-visit planning, and/or daily huddles.
**State Approaches**

States have a number of options to consider in determining how best to advance behavioral health integration in primary care within a Medicaid managed care environment. One option is to take a centralized approach at the state level, by, for example, stipulating behavioral health integration requirements as part of PCMH programs, and then requiring or encouraging health plans to contract with PCMH providers.

Another option is to implement requirements within Medicaid managed care contracts. States may opt to be prescriptive about what exactly behavioral health integration in primary care settings should look like (e.g., by requiring health plans to implement specific care models), or defer to Medicaid MCOs on how exactly to define, implement, fund, and monitor integration of behavioral health into primary care. States may also choose to be prescriptive about some elements (e.g., training or screening requirements) and flexible on others.

<table>
<thead>
<tr>
<th>Centralized</th>
<th>Prescriptive</th>
<th>Flexible</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Oregon</strong> developed a Patient-Centered Primary Care Home (PCPCH) model with tiered expectations for behavioral health integration. Oregon requires its CCOs to assist in advancing providers along the spectrum of the PCPCH model (from Tier 1 to Tier 5), and ties incentive funds to a PCPCH enrollment measure.¹²⁷¹²⁸</td>
<td><strong>Minnesota</strong> requires MCOs to provide SBIRT in primary care clinics, which must use a “valid and reliable” screening tool approved by the state.¹²⁹</td>
<td><strong>Washington State</strong> requires MCOs to increase screening, identification, and referral for behavioral health conditions that commonly occur in primary care settings, and to develop collaborative care models and co-location of primary care and behavioral health providers.¹³⁰</td>
</tr>
<tr>
<td><strong>New York</strong> developed the New York State Patient-Centered Medical Home (NYS-PCMH) which includes enhanced standards for behavioral health integration, among other areas.¹³¹ New York also developed a program enabling PCPs who implement the Collaborative Care model (CoCM) to receive reimbursement for services provided.¹³²</td>
<td><strong>New Hampshire</strong> requires MCOs to ensure physical and behavioral health providers provide co-located or Integrated Care as defined in SAMHSA’s Six Levels of Collaboration/Integration or the Collaborative Care Model to the maximum extent feasible.¹³³</td>
<td><strong>Michigan</strong> requires MCOs to provide primary care training on evidence-based behavioral health service models for PCPs, such as SBIRT, and to reimburse primary care practices for behavioral health screening services.¹³⁴</td>
</tr>
</tbody>
</table>
Measurement and Payment

States have increasingly integrated behavioral health integration measures and incentives into their Medicaid programs, such as through PMCH models, VBP initiatives, and MCO incentive and withhold arrangements.

3. Enhancing Team-Based Care

Team-based care is a key aspect of providing high-quality, coordinated, and comprehensive primary care. In addition to clinical staff, primary care practices often incorporate non-clinical staff into care teams to support functions such as patient education, care management and coordination, and resource navigation. Innovative team-based care models often focus on employing staff with diverse expertise and backgrounds who can collaborate to work at the top of their licenses and provide high-quality care that meets their patients’ needs. States may support team-based care through managed care in a variety of ways, such as encouraging, requiring, or incenting:

- Integration of specific types of staff — such as community health workers (CHWs), peer providers, pharmacists — into care teams;
- Implementation of primary care practice supports (e.g., community health teams); and
- Adoption of care delivery models that emphasize team-based care, such as PCMHs and multi-disciplinary care management.

States, MCOs, and primary care practices can develop team-based care approaches. MCOs in particular can integrate team-based care into their care coordination approaches, in addition to supporting team-based care through training opportunities and provider payment models.

This section outlines design considerations, provides examples of state approaches, and explores payment and measurement strategies for states and MCOs seeking opportunities to advance team-based care.

ENHANCING TEAM-BASED CARE:
Design Considerations Summary

Explore flexible versus prescriptive approaches.
- Which existing care models could be used to help advance team-based care?
- How can the state align team-based care strategies or requirements with other state programs or priorities?
- Will the state require implementation of specific care delivery models supporting team-based care (including use of CHWs) or leave more flexibility for MCOs to develop customized approaches?
- Will the state align Medicaid requirements with existing CHW programs or standards?

Define the roles/responsibilities of the state, primary care teams, and MCOs.
- What aspects of a team-based care strategy can be implemented by MCOs versus PCPs?
- Do primary care practices have capacity to implement team-based care?
- How much administrative capacity does the state have to develop and oversee customized programs?

Determine how to measure, monitor, and reward progress.
- How can MCOs be held accountable for implementing team-based care strategies?
- How will the state ensure that MCOs enhance — and not detract from — local CHW programs?

Leverage payment reform to drive innovation.
- How can providers be compensated for team-based care (recognizing that providers may need higher rates or new reimbursement pathways to fund team-based care activities)?
- How will the state or MCOs fund CHWs?
- Should the state or MCOs define provider payment rates for team-based care?

Determine the need for additional investments.
- What additional funding may be needed to ensure adequate reimbursement for new activities, staffing, or infrastructure deployed by the state, MCOs, and/or providers?
- Will the state or MCOs need to develop new infrastructure to support team-based care in small or rural practices?
Design Considerations

Advancing Team-Based Care

✔ What aspects of a team-based care strategy can be implemented by MCOs versus PCPs?
Some care delivery models, such as PCMHs, are designed to be implemented at the primary care practice level. Other team-based care strategies, such as implementation of multi-disciplinary care management or use of CHWs, can be implemented at the primary care practice or MCO level. For example, MCOs can directly employ CHWs, or contract with organizations employing CHWs to support functions such as care management and coordination. In other cases, CHWs can be employed by provider organizations and more fully integrated into care teams. Additionally, while MCOs have traditionally implemented care management services themselves, often telephonically, some states allow MCOs to delegate care management to primary care practices. States may also consider requiring MCOs to support care management through community-based health teams.

✔ What role should MCOs play in defining team-based care models?
In establishing team-based care through managed care, states can require MCOs to implement, or support primary care practices in implementing specific care models, such as a state-defined community health team model or the National Committee for Quality Assurance (NCQA) PCMH model. Alternatively, states can set more general guidelines for team-based care, allowing individual MCOs more flexibility to customize programs.

A more prescriptive approach allows states to be more directive in how their goals are met and more standardization may reduce provider burden. Additionally, if there is a strong evidence-base for a particular model, implementing a prescriptive approach may be most effective. On the other hand, a more flexible approach may allow MCOs and primary care practices to develop innovative models and meet the specific needs of their patient populations.

Managed Care Procurement

Following is sample state managed care request for proposal language related to team-based care and community supports:

Hawaii (RFI). “MQD is exploring the development of Community Care Teams (CCTs) in collaboration with QI health plans that would provide a narrow set of supports for small and rural PCPs who treat HNHC Medicaid beneficiaries where the patients are located. Examples of services could include triage and referral, linkages to health-related social services, and outreach to populations that are difficult to reach.

23. What opportunities and considerations should MQD be aware of when considering CCTs? What services should CCTs provide and which populations should they target? What types of professionals should staff the teams?

24. What policies and best practices should the state consider in terms of delegation of care management responsibilities to CCTs?”

Virginia (RFP). “In response to this RFP, Offerors shall describe the impacts of the social determinants of health within the five key domains as they relate to health risks, health outcomes, and quality of life. Offerors also shall describe its efforts to address the social determinants of health in the five key domains above.

Offeror’s response shall include, but is not limited to, the following elements…:

10. How has your organization engaged community health workers or other types of workers to improve care?”

Minnesota (RFP). “Describe how the Responder uses non-traditional healthcare services (such as doulas, community EMTs, Community Paramedics, community health workers, etc.) to provide culturally competent care and/or improve health outcomes.”
✔ **Do primary care practices have capacity to implement team-based care?**

Factors such as size, system affiliation, and geography of primary care practices may impact practice capacity to implement team-based care. For example, practices affiliated with large systems may have health system support for care management or PCMH implementation. States with more of these large-health system affiliated provider practices could consider incenting specific care delivery standards.

✔ **How will the state’s approach accommodate small or rural practices?**

Small or rural practices may not have sufficient volume to support a multi-disciplinary team on their own. To support small independent or rural practices, states may consider building state or MCO infrastructure that can support and extend individual practice capabilities. For example, states may consider implementing local community care teams to support primary care practices in delivering PCMH functions such as care coordination or population health management. States can also incentivize MCOs to employ or financially support CHWs or other types of staff to support primary care practices.

✔ **How much administrative capacity does the state have?**

More customized policies and programs to promote team-based care, such as state-defined PCMH standards or staff training/certification requirements (e.g., for CHWs) may require more state resources to design, implement, and oversee than adopting existing models or allowing MCOs flexibility. States may consider allowing MCOs flexibility in team-based care requirements or leveraging external models (e.g., CPC+ model standards, NQCA PCMH model, Individualized Management for Patient-Centered Targets (IMPaCT) model for CHWs) if they do not have the resources to design or administer such programs.

---

### Managed Care Contract Excerpts

Following is sample state managed care contract language related to team-based care and community supports:

**Michigan.** “Contractor must, to the extent applicable, support the design and implementation of Community Health Worker (CHW) interventions delivered by CBOs which address Social Determinants of Health and promote prevention and health education, and are tailored to the needs of community members in terms of cultural and linguistic competency and shared community residency and life experience…”

**Louisiana.** “In addition to the case manager and the enrollee and their family or authorized representative, the care team shall include members based on an enrollee’s specific care needs and goals identified in the individual care plan. The team may change over time as the enrollee’s care needs change. Potential team members shall include, but are not limited to:

- Primary care provider;
- Behavioral health provider(s);
- Specialist(s);
- Pharmacist(s);
- Community health worker(s);
- Peer specialist(s);
- Housing specialist, if the enrollee is identified as homeless; and
- State staff, including transition coordinators.”
How can states align team-based care strategies with other state priorities?

Advancing team-based care is often a key aspect of other state primary care priorities such as behavioral health integration, addressing health-related social needs, and improving care for patients with chronic conditions. A key way states can improve quality for certain services or populations is better integrating staff with expertise in these domains into care teams. As such, these broader policy goals may have implications for the types of staff or models that states choose to incent through MCO contracts. For example, peer providers can support patients in self-management of behavioral health conditions. CHWs or other resource navigator roles can support referrals and coordination with community resources that can assist in addressing health-related social needs. Expanding the role of or better integrating pharmacists or pharmacy technicians into care teams can support better medication management for populations with chronic care needs.

How can providers be compensated for team-based care?

Providers may need higher rates or new reimbursement pathways to fund specific team-based care strategies. For examples, some states have chosen to reimburse practices recognized as PCMHs with higher FFS rates or additional PMPM payments. Others have developed new billing codes for specific payment models, such as the Collaborative Care Model or for new types of staff such as CHWs.

Should the state or MCOs define provider payment rates for team-based care?

In some cases, states define specific FFS or PMPM rates for team-based care activities. In other cases, states may require MCOs to compensate providers for team-based care models, but not define specific rates. For example, states may consider defining standardized provider rates for specific models that will be implemented across different providers and MCOs. Alternatively, it may be appropriate for MCOs to have flexibility in determining rates for team-based care activities when they have the flexibility to implement more customized models.

In cases where states give MCOs responsibility for developing payment rates, states may provide guidance on the factors MCOs should consider in determining provider payment. For example, states may direct MCOs to base rates on factors such as patient population demographics, clinical complexity, cost, and care model.
How can MCOs be held accountable for implementing team-based care strategies?

A common strategy for holding MCOs accountable for team-based care initiatives is through setting targets for member enrollment in PCMHs or members served by CHWs. States may tie these targets to MCO payment through withhold or incentive arrangements. Another strategy is incorporating team-based care elements into MCO care management requirements, such as encouraging use of multi-disciplinary care teams to support member needs. States may also consider implementing team-based care requirements within performance improvement projects, VBP initiatives, or § 1115 demonstration projects or pilot programs.

Integrating CHWs into Care Teams

Will the state define goals for the use and uptake of CHWs?

The specific definition and role of CHWs varies across states and organizations. A key aspect that may distinguish CHWs from other roles is that they are often hired, in part, based on their lived experience and connections to local communities. Common CHW roles include:

- Providing direct patient services such as health education, screenings, and self-management support;
- Providing health care and social service navigation and coordination;
- Advocating for individual and community needs; and
- Enhancing communication, understanding, and collaboration between individuals and communities, health, and social service systems.

States may be prescriptive in defining the use of CHWs in managed care contracts. For example, the state may: (1) require CHW to enrollee ratios; (2) define the scope of CHW services; (3) define CHW training requirements; or (4) require pilot implementation of a particular type of CHW model, such as the ImPaCT model.

Alternatively, the state may leave more flexibility for MCOs to develop customized approaches. For example, states may craft a managed care request for proposals that asks respondents to present their approaches to integrating CHWs into their care management processes and into their provider networks, or design a contract requirement that allows MCOs to implement a community-based care management program that includes community health workers.
How will the state or MCOs fund CHWs?

States may integrate CHW services into state plan benefits as either a standalone service (e.g., health education) or a component of another service, such as health homes. If CHWs are integrated into a state plan service, costs associated with CHWs can be included in managed care rate-setting processes as a portion of the medical premium. For example, Minnesota Medicaid reimburses for diagnosis-related health education services provided by CHWs who: (1) hold a CHW certificate from a school offering a standardized curriculum; and (2) are supervised by a variety of provider types such as physicians, dentists, public health nurses, and/or mental health professionals.171

States may also direct MCOs to use CHWs in the context of their contractual responsibilities to coordinate and manage care — for example, to coordinate medical services with services received from community and social support providers. States may consider whether the administrative or non-benefit portion of the MCO capitation rate is adequate to support these functions, and may clarify that CHW expenditures can be included in the numerator of the medical loss ratio (MLR) as an activity that improves health care quality.

To the extent that CHWs are not integrated into state plan benefits, states may also clarify that the MCO can voluntarily provide CHW services as a value-added service and also report that expenditure in the numerator of the MLR. Although value-added services cannot be used in the development of the capitation rate, inclusion in the numerator of the MLR may offset disincentives associated with MCO investment in this area.

Will the state align Medicaid requirements with existing CHW programs or standards?

Some states, or state CHW associations, have developed frameworks, training curricula, or certification standards to support standardization of the CHW profession and ensure CHWs are proficient in core capabilities.172 States may choose to align CHW requirements or definitions with those certification standards, or defer to MCOs and their community-based partners to define appropriate standards for their staff.

How will the state ensure that MCOs enhance — and not detract from — local CHW programs?

A potential consequence of MCO CHW targets or other utilization/integration requirements is that MCOs may hire CHWs away from providers or CBOs. To avoid disrupting local care delivery efforts, states may consider engaging with stakeholders or asking question on RFIs/RFPs to assess whether MCOs, CBOs, and providers are currently integrating CHWs into care teams. States could also consider encouraging their MCOs to use a “buy, not build” approach to support CBO or provider team-based care capacity, rather than hiring CHWs themselves. Finally, states may consider piloting new CHW programs in a specific locality before implementing new approaches statewide to limit disruptions.
State Approaches

States may take various approaches to supporting team-based care in Medicaid programs. Some approaches support team-based care more generally, while others support the addition of specific types of staff, such as CHWs, to care teams.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Louisiana</td>
<td>Louisiana Medicaid and the Center for Healthcare Value and Equity at the Louisiana State University Health Sciences Center plan to pilot a CHW demonstration project, based on the IMPaCT model, serving high-risk Medicaid members in a target region in Louisiana. The goal for the pilot is to align MCO CHW use with evidence-based practice and build capacity to efficiently scale CHW programs across managed care.</td>
</tr>
<tr>
<td>Pennsylvania</td>
<td>Pennsylvania’s Medicaid PCMH program includes a requirement that practices deploy a community-based care management team that consists of licensed professionals (e.g., nurses, pharmacists, or social workers) and unlicensed professionals (e.g., peer recovery specialists, peer specialists, CHWs, or medical assistants). The team collaborates with providers and MCOs to support individuals with complex care needs, develop care plans, and connect individuals to community resources.</td>
</tr>
</tbody>
</table>
| Vermont     | Vermont has implemented CHTs to support PCMH capacity and link patients with community services. While Vermont has not implemented Medicaid managed care, aspects of this model and the state’s contract with its all-payer ACO (OneCare) could be adapted to a managed care environment:  
  - Specific aspects of CHTs, including staffing, service configuration, and location (embedded within practices vs. offsite) are locally defined based on community needs.  
  - Medicare, Medicaid, and private payers share the costs of CHTs through PMPM payments; there is no cost to PCMHs or patients for CHT services.  
  - Vermont requires OneCare to use a portion of prepaid shared savings funds to support community health teams, in accordance with state guidelines. |
Measurement and Payment

Approaches for measuring and tracking team-based care implementation include CHW staffing, utilization targets, and targets for percent of members assigned to PCMHs. States may also incent provider adoption of team-based care models or CHWs through new payment mechanisms or increased rates.

</table>
4. Using Technology to Improve Access

Technology can enhance the capacity of PCPs to address a wider range of needs, such as behavioral health issues. “Telehealth” refers broadly to electronic and telecommunication technologies and services that support remote care delivery. It can be divided into two broad categories: provider-to-provider platforms and direct-to-consumer platforms. Reimbursement and regulation of telehealth in Medicaid vary from state to state. Almost all states (49 and D.C.) reimburse for live video services, but fewer reimburse for remote patient monitoring.190

Telementoring programs also have the potential to enhance primary care capacity and increase access to services. For example, Project ECHO is a provider-to-provider model that connects expert specialist teams to primary care clinicians via weekly videoconferences to help them treat patients with complex health needs, especially in rural and underserved communities.191 Through telementoring and guided practice, participating providers develop the competencies needed to effectively manage their complex patients independently and in their communities. Unlike teleconsultations, the goal of Project ECHO is to expand the capacity of PCPs to independently manage their patients with complex health care needs. A 2011 study found that patients receiving care from primary care providers who participated in ECHO received care that was either comparable or, in some circumstances, better than those who received care from specialists at the University of New Mexico Health Sciences Center.192

Similarly, telepsychiatry peer-to-peer models create opportunities for consultation between PCPs and psychiatric specialist providers to enhance primary care capacity. This type of model may be aimed at particular populations, such as children and new mothers as in the Massachusetts Child Psychiatry Access Program, or children prescribed psychotropic medications in the Pennsylvania Telephonic Psychiatric Consultation Service Program (TiPS). In one study, specialty-related eConsults at a Community Health Center in Connecticut resulted in costs of $82 per patient per month less than for face-to-face visits for a Medicaid population.193

This section outlines design considerations, provides examples of state approaches, and sample procurement and contract language for states seeking to support telehealth services within Medicaid managed care programs.
Design Considerations

✔ Will the state encourage telehealth activities generally, or require buy-in to a particular centralized model?
Some states may choose to promote use of technology among MCOs and providers more generally, or to encourage or require a specific approach to meet particular needs they have identified in their state. For example, physical health MCOs in Pennsylvania must work with all other physical health and behavioral health MCOs in a health care region to collaboratively choose one psychiatric consultation team. This requirement sustains earlier efforts by MCOs to develop a centralized TiPS program. While this centralized approach allows for less variation at the community-level, the broad availability of the program, no matter the specific affiliation with a plan, may increase uptake of the service.

✔ How will the state identify and address barriers to the uptake of telehealth or telemedicine services?
States may consider identifying and addressing barriers to telehealth uptake. Common barriers include access to technology and broadband, licensure, privacy concerns, and state law and reimbursement policies.197 In Medicaid reimbursement, a common restriction is on the “originating site,” or where a patient is located. Many policies exclude a patient’s home as an originating site, but 13 states explicitly allow and reimburse service to a patient’s home.198 However, less restrictive policies alone may not incentivize the uptake of telehealth services.199

Managed Care Procurement

Following is sample state managed care request for proposals and request for information language related to telehealth:

Hawaii.194 “How can […] health plans support initiatives like Project ECHO and expand the reach to all provider groups? What barriers do you see in providing this support and what solutions would help overcome these barriers?”

North Carolina.195 “[Response shall include […]]
Experience with innovative telemedicine modalities and pilot programs in other states/markets, and the proposed telemedicine approach to encourage use of telemedicine, including types of programs, and targeted providers, geographies (including rural), services, and members.”

Virginia.196 “Offerors shall consider the following when establishing and maintaining its networks: […]
The availability of triage lines or screening systems, as well as the use of telemedicine, e-visits, and/or other evolving and innovative technological solutions.
Offerors, in response to this RFP, also shall identify any deficiencies in its provider network that meets access to timely care for services and provide the plans to overcome such deficiencies.”
States may also assess how MCO prior authorization or utilization management processes have affected access to telemedicine services. The state may clarify expectations surrounding reimbursement for telemedicine services in its managed care contracts and note both appropriate and inappropriate limitations: for example, whether the plan may require providers to use certain platforms or require an in-person consultation for certain services. The state may also consider mechanisms by which PCPs can access information on telemedicine services, such as prescribed medications and exam findings.

✔ **How can the state and MCOs invest in common telehealth infrastructure and programs to support PCPs?**

States may fund telehealth programs in a variety of ways. Telemedicine services are often considered when developing capitation rates for Medicaid MCOs, and can be bundled into VBP contracts.

Telementoring and peer-to-peer consultation activities may not be in themselves a billable service, which sometimes requires more creative funding structures. In New Mexico, for example, the state embeds specific funding for its Project ECHO initiative in the MCO capitation rate, and in turn requires MCOs to pay for its “fair share of administrative costs” for Project ECHO. MCOs may also voluntarily fund common telehealth infrastructure. For example, in 2017, the Oregon Rural Practice-based Research Network developed a multi-payer infrastructure, called the Oregon ECHO Network, to support a coordinated network of ECHO hubs around the state and provide programming and support services. Eight of the 16 CCOs, covering 75 percent of the Medicaid population, subscribe to this service.202

---

**Managed Care Contract Excerpts**

Following is sample state managed care contract language related to telehealth services:

**New Mexico.**200 “The contractor shall participate in Project ECHO, in accordance with State prescribed requirements and standards including, but not limited to, paying its fair share of administrative costs as negotiated between the CONTRACTOR and Project ECHO and approved by HSD to support Project ECHO and shall”

“Work collaboratively with the University of New Mexico, HSD, and Providers on Project ECHO;”

“Identify high needs, high cost Members who may benefit from their providers participating in Project ECHO;”

“Identify PCPs who serve high needs, high cost Members to participate in Project ECHO;” …

“Reimburse Primary Care clinics for participating in the Project ECHO model;”

“Provider Claims data to support evaluation of Project ECHO; …”

“Track quality of care and outcome measures related to Project ECHO…”

**Virginia.**201 “The Contractor shall provide coverage for telemedicine services as medically necessary, and within at least equal amount, duration, and scope as is available through the Medicaid fee-for-service program. Telemedicine is defined as the real time or near real time two-way transfer of medical data and information using an interactive audio/video connection for the purposes of medical diagnosis and treatment services. Telemedicine may also include ‘store and forward’ technology, where digital information (such as an X-ray) is forwarded to a professional for interpretation and diagnosis;”
## State Approaches

<table>
<thead>
<tr>
<th>Flexible</th>
<th>Prescriptive</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Virginia</strong> recognizes a wide variety of providers as “remote” providers for telemedicine and allows MCOs the ability to cover specialist consultative services like telepsychiatry as requested by a member’s PCP.</td>
<td><strong>New Mexico</strong> requires its MCOs to participate in Project ECHO by contracting with the New Mexico Health Sciences Center, which operates Project ECHO programs in the state, and reimbursing primary care clinics for Project ECHO. The state embeds funding for Project ECHO into the MCO capitation rate and expects MCOs to pay its fair share of administrative costs for the program. The contract also requires MCOs to reimburse PCPs for participating in the program.</td>
</tr>
<tr>
<td><strong>Arizona</strong> directs its MCOs to engage members through technology, including web-based applications and mobile device technologies, and to identify populations that can benefit from web- and mobile-based technology used to assist members with self-management of health care needs.</td>
<td><strong>Pennsylvania’s Telephonic Psychiatric Consultation Service Program</strong> increases the availability of peer-to-peer child psychiatry consultation teams to PCPs and other prescribers of psychotropic medications for children. The state's MCOs are required to contract with a telephonic Psychiatric Consultation Team that provides real-time telephonic consultative services to PCPs and prescribers. The team must include a child psychiatrist, behavioral health therapist, and a care coordinator.</td>
</tr>
</tbody>
</table>

## Measurement and Payment

States may choose to define targets relating to the uptake of telehealth services. For example, **New Mexico** includes a telemedicine target as one of several “delivery system improvement performance targets.” The MCO must increase the number of unique members served through telemedicine visits with physical health and behavioral health specialists by 20 percent in rural, frontier, and underserved urban areas, as compared to the previous year. Twenty out of 100 points is allocated to a telemedicine target. The state imposes performance penalties of 1.5 percent of the capitation rate if the performance targets are not met.

## Moving Forward

As the pace of telehealth accelerates, states may consider not only the ways that telehealth may increase access to care, but also the ways in which it may exacerbate disparities. For example, Medicaid recipients are less likely to use telehealth tools, such as patient portals and live video communication. In order for telehealth to realize its potential for Medicaid populations, states may look to its MCOs and providers to design creative engagement strategies for Medicaid populations.
V. Three State Approaches to Patient-Centered Medical Homes

One common state strategy for expanding primary care practice capabilities is supporting PCMH implementation. The medical home is a care delivery model aimed at providing patient-centered, accessible, coordinated, and comprehensive primary care with a commitment to quality improvement. These foundational primary care elements can be opportune building blocks for states interested in incenting more advanced provider capabilities.

While many states have adopted PCMH models, CHCS collected information about three state PCMH programs that go beyond primary care basics and promote enhanced care delivery transformation. This PCMH analysis explores how New York, Ohio, and Oregon’s PCMH requirements go beyond the NCQA’s 2017 PCMH standards, one of the most widely adopted PCMH models, to address the following high-quality primary care attributes:

1. Integration of primary health care with public health, social services, and behavioral health;
2. Proactive patient and family engagement to address physical, social, and cultural barriers to care;
3. Mobile or digital health;
4. Active use of data to manage and improve patient care and system performance;
5. Geographic empanelment, including appropriate risk stratification and targeting;
6. Multidisciplinary teams with community health workers;
7. Medical home capabilities as a foundation.

The following analysis also describes how states leverage Medicaid managed care for implementation, as well as specific payment methods used to reimburse PCMHs.

Overall, CHCS found that all three state programs have standards that go beyond NCQA PCMH behavioral health (BH) core requirements. For example, these three state programs include additional BH screening requirements, coordination standards, and quality metrics. These programs also include a number of advanced patient engagement capabilities such as training staff...
Advancing Primary Care Innovation in Medicaid Managed Care: A Toolkit for States

on cultural competence, meeting patient language needs, and requiring care plan elements beyond baseline NCQA PCMH requirements. However, these programs have fewer advanced requirements related to mobile health, use of data, geographic empanelment, and multidisciplinary teams, suggesting areas for future development.

This table is a CHCS analysis of how state PCMH requirements compare to NCQA PCMH 2017 requirements, not a comprehensive description of state PCMH programs. State standards that are optional or similar to NCQA core requirements are not listed. The crosswalk does list standards that are required by state programs but optional (“elective”) under NCQA PCMH 2017.

<table>
<thead>
<tr>
<th>New York</th>
<th>Oregon</th>
<th>Ohio</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overview of approach</td>
<td>Overview of approach</td>
<td>Overview of approach</td>
</tr>
<tr>
<td>The New York State Department of Health, in collaboration with NCQA, developed the New York State Patient-Centered Medical Home (NYS PCMH), which builds off the NCQA PCMH model.</td>
<td>Oregon Health Authority (OHA) administers the Patient-Centered Primary Care Home Program (PCPCH), which is integrated into its broader CCO program.</td>
<td>The Governor’s Office of Health Transformation and the Ohio Department of Medicaid developed the Comprehensive Primary Care (Ohio CPC) program, which closely aligns with Medicare’s CPC+ program.</td>
</tr>
<tr>
<td>- In 2017, NYS transitioned its model of advanced primary care from Advanced Primary Care (APC) to NYS PCMH.</td>
<td>- The PCPCH program was created through 2009 legislation.</td>
<td>- Ohio CPC was developed through a SIM award and implemented under existing Medicaid authority. CMS approved a CPC SPA in 2018.</td>
</tr>
<tr>
<td>- NYS PCMH converts 12 ‘Elective’ NCQA criteria into ‘core’ (required) criteria, in the areas of behavioral health, care coordination, Health IT, and VBP. NCQA reviews practice documentation and determines recognition status.</td>
<td>- PCPCH requirements have some alignment with the NCQA PCMH model — in some cases, recognized NCQA PCMH clinics in Oregon may submit an abbreviated PCPCH application.</td>
<td>- Ohio CPC practice requirements are similar to CPC+ requirements, though payment streams differ. To enroll in the program, practices submit application to Ohio Medicaid. Ohio Medicaid works with a vendor to conduct program monitoring.</td>
</tr>
<tr>
<td>- The NY PCMH program covers initial provider costs for recognition and provides technical assistance through a SIM award.</td>
<td>- PCPCH clinics are recognized at five different tiers. All practices must meet the 11 must-pass standards and select optional standards. To be recognized at the highest tier (5-STAR), practices must also meet 11 out of 13 specified measures. OHA reviews practice applications and determines recognition status.</td>
<td>- Practices are compensated for PCMH activities and cost and quality performance.</td>
</tr>
<tr>
<td>- Participating practices are eligible for enhanced reimbursement under the Medicaid PCMH Incentive Program. This program was created through 2009 legislation and CMS approved a related state plan amendment (SPA) in 2010.</td>
<td>- CCOs must include PCPCHs in their networks and PCPCH enrollment is a CCO quality measure.</td>
<td>- Previously, Ohio CPC eligibility criteria included national accreditation or CPC+ participation. OH removed these requirements in 2019.</td>
</tr>
<tr>
<td>- Selected practices are also eligible for enhanced reimbursement (typically via P4P arrangements) from commercial health plans participating in Regional Oversight Management Committees (ROMC).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### New York

**Attribute 1: Integration of primary health care with public health, social services, and behavioral health**

- **NYS PCMH requires that practices:**
  - Screen for alcohol use disorder and SUD.
  - Set expectations for information exchange for BH referrals.\(^{257,258}\)

- **PCPCH requires that practices:**
  - Screen for BH conditions, including SUD.
  - **PCPCH 5-STAR Criteria include:**
    - PCPCH has a cooperative referral process with specialty mental health, substance abuse, and developmental providers.
    - PCPCH provides integrated BH services, including population-based, same-day consultations by behavioral health providers.
    - PCPCH tracks referrals and cooperates with community service providers outside the PCPCH.\(^{259,260,261}\)

- **Ohio CPC requires that practices:**
  - Employ care management strategies and plans that support integration of BH.\(^{262,263}\)
  - **Additionally, the CPC quality and efficiency measure set includes:**
    - Antidepressant medication management;
    - Follow up after hospitalization for mental illness;
    - Tobacco screening and cessation intervention;
    - Initiation of alcohol and other drug dependence treatment; and
    - Behavioral health-related inpatient admits per 1,000.\(^{264,265}\)

### Oregon

**Attribute 2: Proactive patient and family engagement to address physical, social, and cultural barriers to care**

- **NYS PCMH requires that practices:**
  - Address disparities in care.
  - Educate staff on health literacy or cultural competence.\(^{266,267}\)

- **PCPCH requires that practices:**
  - Offer providers who speak a patient/family’s language or telephonic trained interpreters.\(^{268}\)
  - **PCPCH 5-STAR Criteria include:**
    - PCPCH develops written care plan for patients with complex medical or social concerns. Plans should include at least self-management goals, goals of care, and action plan for exacerbations of chronic illness.
    - PCPCH translates written patient materials into all languages spoken by more than 30 households or 5% of the practice’s patient population.
    - Assess patient experience through CAHPS survey and use data in quality improvement process.\(^{269,270,271}\)

- **Ohio CPC requires that practices:**
  - Create and provide care plans to high-risk patients that include patient preferences, functional/lifestyle goals, potential barriers to meeting goals, and self-management plans.\(^{272,273}\)

### Ohio

**Attribute 3: Mobile or digital health**

- **NYS PCMH requires that practices have a system for two-way electronic communication between the practice and patients.**\(^{274,275}\)

- **No requirements.**

- **No requirements.**
<table>
<thead>
<tr>
<th>New York</th>
<th>Oregon</th>
<th>Ohio</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Attribute 4: Active use of data to manage and improve patient care and system performance</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| NYS PCMH requires that practices:  
  - Exchange data with the State Health Information Network for New York (SHIN-NY) that supports management of complex patients. NYS provides funding through SIM for participating practices to connect to the SHIN-NY.  
| **Attribute 5: Geographic empanelment, including appropriate risk stratification and targeting** | | |
| NYS PCMH requires that practices have a comprehensive risk stratification process. | No requirements. | Ohio CPC requires that practices use risk stratification from payers and other available data to stratify patients and integrate risk status into health records and care plans. In cases where attribution cannot be determined based on patient choice or claims, geography may be a factor for determining attribution. |
| **Attribute 6: Multidisciplinary teams with community health workers** | | |
| No requirements beyond NCQA PCMH Recognition. | No requirements. | No requirements. |
| **Attribute 7: Medical home capabilities as a foundation** | | |
| NYS PCMH builds off the NYS APC and the NCQA PCMH model. NYS PCMH converts 12 ‘elective’ NCQA criteria into ‘core’ (required) criteria (as described in “Attribute 1-6” rows above, and “other required standards” row below). | Oregon includes required and optional standards similar to NCQA PCMH standards. Oregon’s PCPCH program organizes standards into the domains of access to care, accountability, comprehensive whole-person care, continuity, coordination and integration, and person and family centered care. | Ohio CPC includes many requirements similar to NCQA PCMH and CPC+ standards. Ohio CPC organizes standards into the domains of access to care, risk stratification, population health management, team-based care, care management, follow up after hospital discharge, test and specialist referrals, and patient experience. Previously, participating practices were required to have either national accreditation or participate in CPC+. For 2019, OH has removed these requirements. |
### New York

NYS PCMH requires that practices:
- Provide continuity of medical record information when the office is closed;
- Make care plans accessible across settings of care;
- Obtain patient discharge summaries;
- Set expectations for information exchange for specialist referrals; and
- Engage in an up-side risk contract.\(^{294,295}\)

### Oregon

PCPCH requires practices to:
- Track at least one quality measure from the PCPCH quality measure set;\(^{296}\)
- Report they routinely offer comprehensive preventive and medical services;
- Have a written agreement with hospital providers or provide routine hospital care;\(^{297}\) and
- Coordinate hospice and palliative care, and counseling.

PCPCH 5-STAR criteria require practices to:
- Develop a clinic-wide improvement strategy;\(^{298}\)
- Meet a benchmark for percent of patient visits with assigned clinician or team;\(^{299}\)
- Define care coordination roles for care team members and tell patients/family the name of the team member responsible for their care coordination; and
- Exchange information and coordinate care with specialized settings.\(^{300,301,302}\)

### Ohio

Ohio CPC requires that practices:
- Provide continuity of medical record information when the office is closed;\(^{303}\)
- Coordinate with managed care plans for population health and care management;
- Ask about self-referrals and request reports from clinicians; and
- Obtain patient discharge summaries.\(^{304,305,306}\)

---

### Payment method

Practices with NCQA PCMH 2014 Level 3 Recognition, NCQA PCMH 2017 Recognition, or NYS PCMH Recognition (NCQA 2017 + 12 addition ‘Core’ requirements) are eligible to receive incentive payments through the Medicaid PCMH Incentive Program, effective July 1, 2018:
- Medicaid Managed Care $6 PMPM.
- FFS incentive payment add-on amounts of $29.00 and $25.25 for professional and institutional claims respectively, available for qualified evaluation and management codes. \(^{307}\)

Select practices that are recognized as NYS PCMH can receive enhanced reimbursement through commercial payers that participate in three ROMCs. While the payment arrangements vary from ROMC to ROMC, they typically include either a PMPM or P4P. \(^{308}\)

CCOs are required to implement value-based payments and prioritize implementing alternative payments and incentives for PCPCHs. \(^{309}\)
- In 2016, all CCOs allocated at least 31% of primary care spending to non-claims-based payment, which include: payments to incent efficiency or quality, payments for patient-centered medical homes, or payments to improve provider capacity and infrastructure. \(^{310}\)
- Starting in 2020, CCOs will be required to provide PMPM payments to PCPCH clinics, as a supplement to any other payments, in order to support development of infrastructure and operations for PCPCHs. \(^{311}\)

CPC practices may be eligible for two payment streams in addition to existing payment arrangements:
- PMPM payment, to support CPC activity requirements. PMPM amounts are based on risk tiers (Tier 1-$1.80, Tier 2-$8.50, Tier 3-$22). \(^{312}\)
- Shared savings payment, based on achieving total cost of care savings (available to practices or practice partnerships with at least 60,000 member months over the performance period). \(^{313,314}\)
- To be eligible for PMPM and shared savings payments, practices must pass 50% of applicable quality and efficiency metrics. \(^{315}\)

<td></td>
</tr>
<tr>
<td></td>
<td>- PCPCH enrollment is one of the 19 CCO quality measures used to determine reward payments out of ‘quality pool’ funds. The PCPCH enrollment measure is based on percentage of CCO membership enrolled in a PCPCH, with higher tier PCPCHs weighted more heavily. 319,320</td>
<td></td>
</tr>
</tbody>
</table>
VI. Conclusion

Primary care is the backbone of any high-functioning health care system, particularly for low-income populations. Ongoing concern about the high cost and poor outcomes of health care in the U.S. continues to create an impetus for states to increase investments in primary care.

This toolkit seeks to help states use Medicaid’s managed care purchasing levers to advance PCI approaches and better serve low-income populations. It outlines the range of other state approaches, as well as key questions and considerations, but does not seek to identify the right approach. There is no one-size-fits-all approach to promoting advanced primary care approaches within Medicaid managed care, particularly given differences in states’ populations, geographies, patient needs, and provider and health plan markets. Using this toolkit, states can consider what works best for them in their particular state context.

266 These competencies are optional under NCQA PCMH.

268 NCQA PCMH only requires practices to assess language needs of their population.

269 NCQA PCMH has less advanced requirement related to meeting language needs. NCQA PCMH requires practices to assess language needs of their population and has an optional standard related to tailoring patient materials to communication needs.

270 NCQA has similar, but less extensive, requirements related to care plan development, and collection of patient experience data. NCQA PCMH standards require that practice develop care plans, but inclusion of a self-management plan is optional. NCQA requires similar collections and use of patient experience data but use of a standardized survey tool is optional.

274 These competencies are optional under NCQA PCMH.

276 This competency is optional under NCQA PCMH.

277 This competency is optional under NCQA PCMH.
